The prevalence of Diabetes Mellitus

- One in 11 adults have diabetes mellitus (DM).
- The burden of Type 2 DM is continuously increasing.

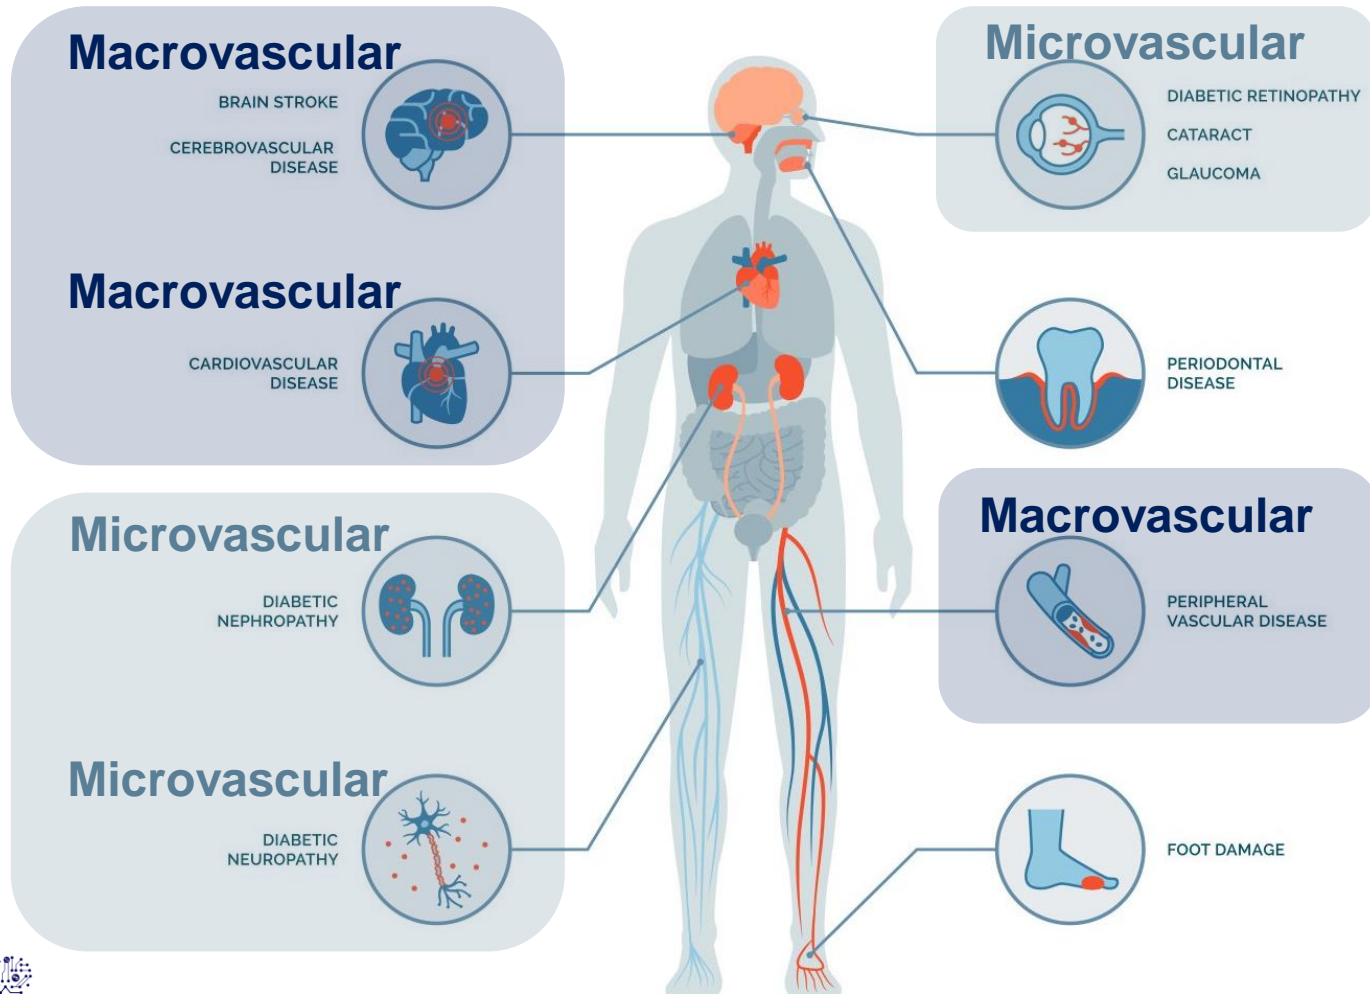

Zheng Y, et. al. Nat Rev Endocrinol. 2018

Lin X, et. al. Sci Rep. 2020

Diabetes-related complications

- The **diabetes-related complications are very common and increasing.**

Harding JI, et. al. Diabetologia. 2019

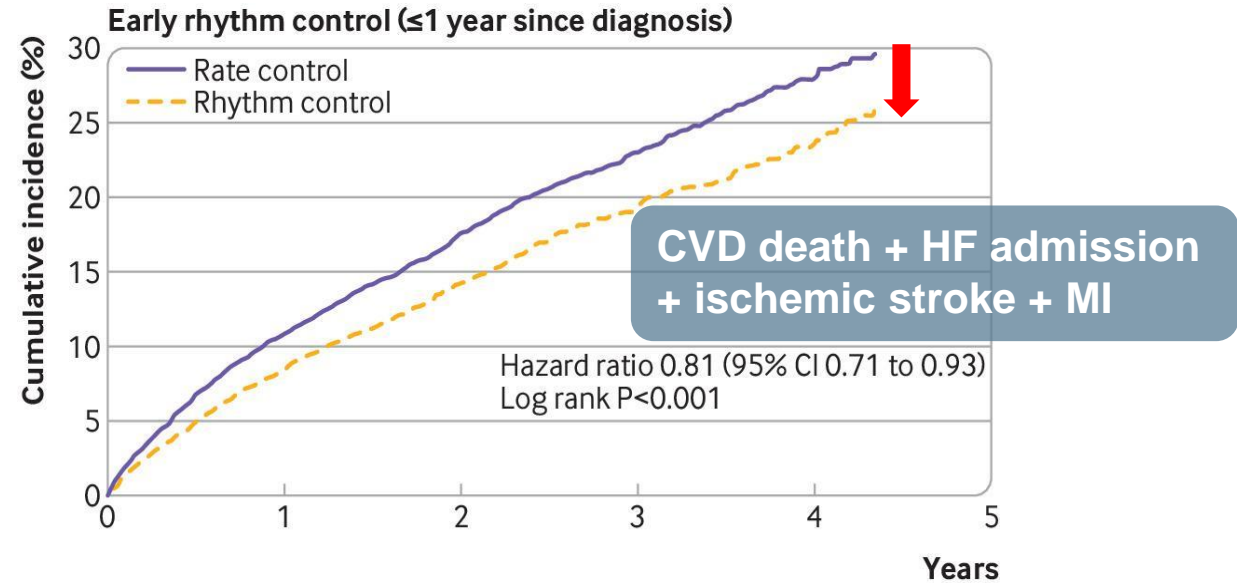

Early rhythm control in AF patients

- Early rhythm control (ERC) within 1 year after AF diagnosis significantly reduces the risk of major adverse cardiovascular outcomes (MACE) in general patients.

No. at Risk					
Usual care	1394	1169	888	405	34
Early rhythm control	1395	1193	913	404	26

No at risk (weighted cumulative incidence)

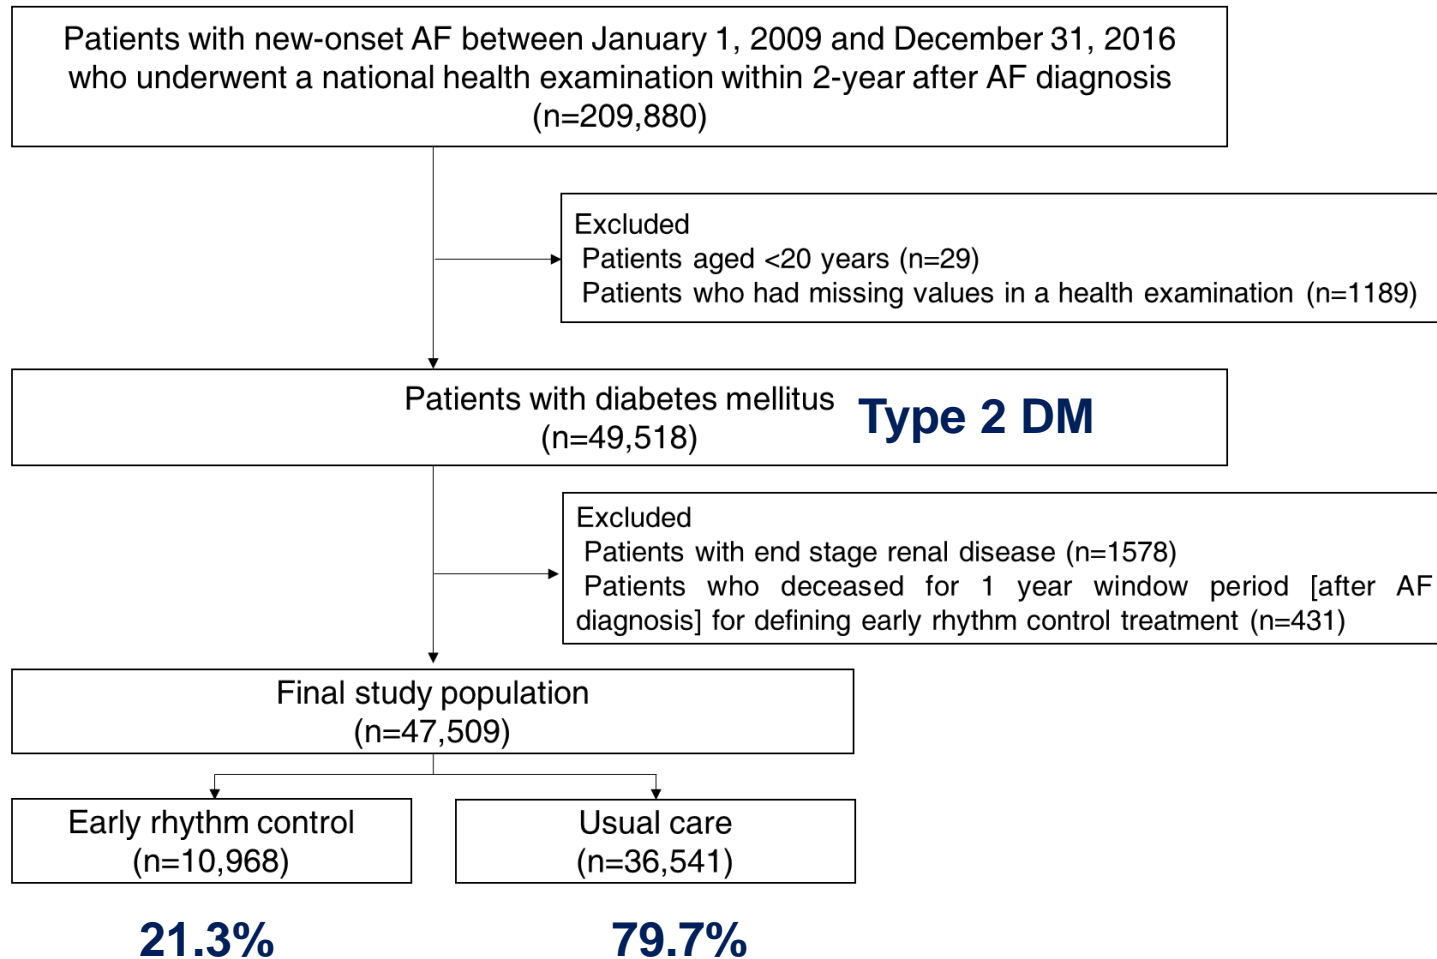

Rate control	7077 (0%)	5084 (10.8%)	3248 (17.5%)	1841 (22.9%)	728 (27.8%)
Rhythm control	9246 (0%)	6885 (8.3%)	4361 (14.2%)	2466 (19.3%)	1033 (23.4%)

Study Aim

- To assess the **impact of ERC on ischemic stroke, diabetes-related complications, and all-cause death in patients with DM and newly diagnosed AF** using a **nationwide population-based cohort**.

Study Flow

- **ERC**: any of the following ≤ 1 year of AF diagnosis
 - 1) Anti-arrhythmic drug (Ic or III)
 - 2) Direct current cardioversion
 - 3) AF catheter ablation
- Primary: **ischemic stroke**
- Secondary:
 - 1) Composite of **macrovascular complications** (ischemic stroke + myocardial infarction + peripheral artery disease)
 - 2) Composite of **microvascular complications** (diabetic retinopathy + diabetic neuropathy + end-stage renal disease)
 - 3) **All-cause death**
- Survival analysis (adjusted Kaplan-Meier)
- Multivariable Cox regression

Results: *Baseline characteristics*

Category	Total (n=47,509)	Usual care (n=36,541)	Early rhythm control (n=10,968)	P-value

Results: Outcomes

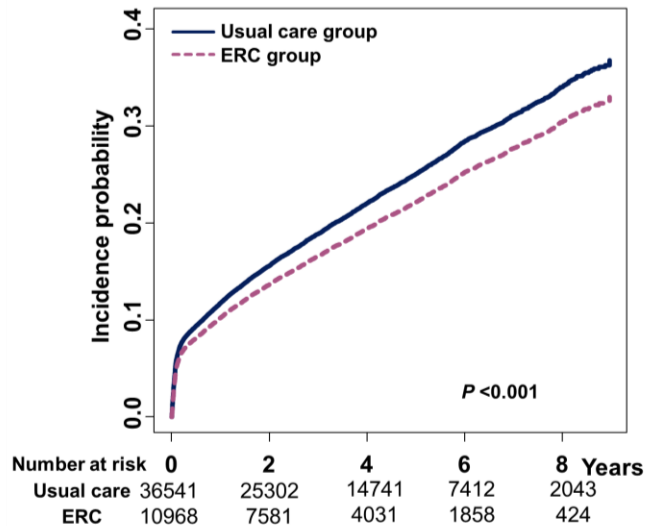

Primary outcome: Ischemic stroke

Composite of macrovascular complications

Composite of microvascular complications

All-cause death

- Mean follow-up duration: 4.3 ± 2.3 years

	IR per 1000 PY	Adjusted HR (95% CI)	P-value
Primary outcome: ischemic stroke			
Usual care	13.7	1 (reference)	
Early rhythm control	11.2	0.772 (0.699-0.854)	<0.001
Secondary outcomes			
Composite of macrovascular complication*			
Usual care	20.5	1 (reference)	
Early rhythm control	17.4	0.792 (0.730-0.859)	<0.001
Composite of microvascular complication**			
Usual care	63.1	1 (reference)	
Early rhythm control	53.2	0.861 (0.819-0.904)	<0.001
All-cause death			
Usual care	33.0	1 (reference)	
Early rhythm control	27.4	0.922 (0.866-0.983)	0.012

* Composite of macrovascular complications : ischemic stroke + myocardial infarction + peripheral artery disease
 ** Composite of microvascular complications : diabetic retinopathy + diabetic neuropathy + ESRD

Results: *Competing risk analyses*

	Adjusted HR (95% CI)	P-value
Primary outcome: ischemic stroke		
Usual care	1 (reference)	
Early rhythm control	0.769 (0.695-0.851)	<0.001
Secondary outcomes		
Composite of macrovascular complication*		
Usual care	1 (reference)	
Early rhythm control	0.788 (0.726-0.856)	<0.001
Composite of microvascular complication**		
Usual care	1 (reference)	
Early rhythm control	0.857 (0.816-0.901)	<0.001

* Composite of macrovascular complications : ischemic stroke + myocardial infarction + peripheral artery disease

** Composite of microvascular complications: diabetic retinopathy + diabetic neuropathy + end-stage renal disease

Results: Subgroup analyses for ischemic stroke

	Subgroup	Group	IR per 1000 PY	Treatment Comparison		Model 3 HR (95% CI)	P-value	P-for-interaction
				Early rhythm control	Usual care			
Age	<65 years	Usual care	7.9	0.699 (0.573-0.851)	1 (reference)	<0.001	0.304

		Early rhythm control	5.6					
	Yes	Usual care	23.5	0.740 (0.661-0.828)	1 (reference)	<0.001		
		Early rhythm control	14.5					

Summary of Results

Discussion

- **AF in patients with DM** is associated with **significantly increased risk of cardiovascular events** (myocardial infarction, stroke, and heart failure), **chronic kidney disease, and death.**

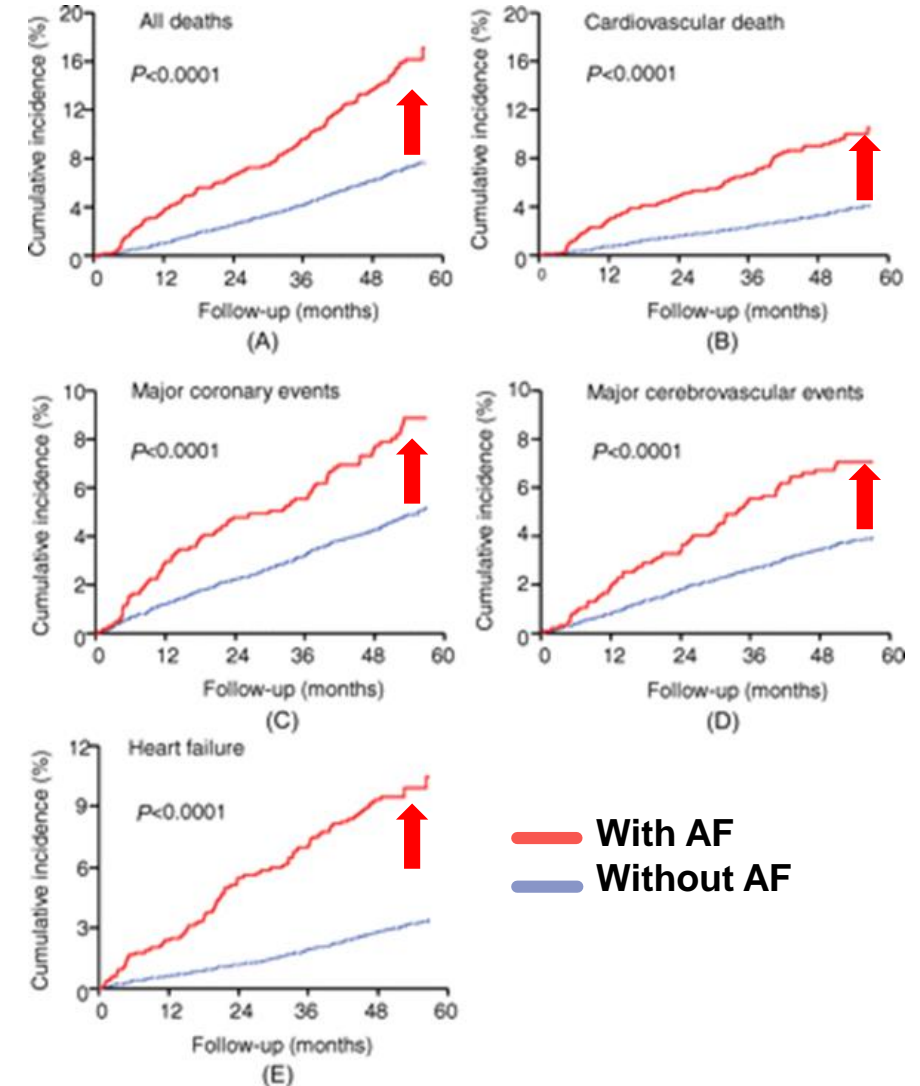

(Du X, et al. Eur Heart J. 2009, Geng T, et al. Diabetes Care. 2022)

- In the **EAST-AFNET 4 trial**, subgroup of DM showed decrease in **MACE** but without statistical significance.

(Kirchhof P, et al. N Engl J Med. 2020)

Subgroup	N(%)	
Diabetes		
No diabetes or impaired glucose tolerance	2090 (75%)	
Yes (managed by diet, oral antidiabetics, and/or insulin)	694 (25%)	

Kirchhof P, et al. N Engl J Med. 2020

Du X, et al. Eur Heart J. 2009

Discussion

- The **mechanism** that underlies the reduction of diabetes-related complications due to ERC may be attributed to the **restoration of sinus rhythm** resulting in reduced systemic inflammation.

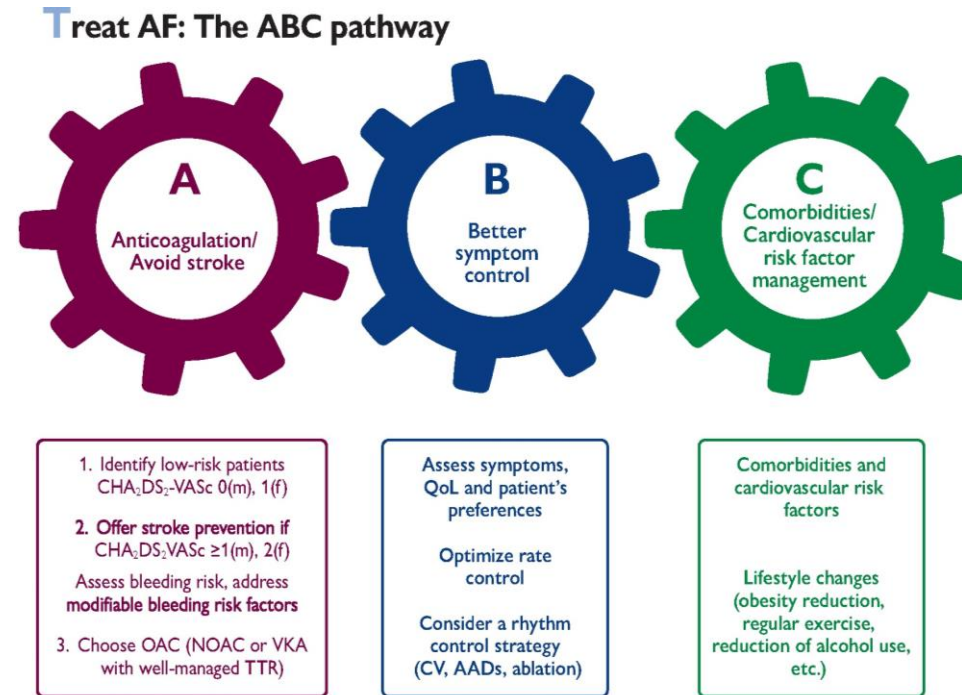

(Tsadok MA, et al. Circulation. 2012)

- As DM patients are commonly accompanied by various comorbidities, current paradigm of more **holistic AF management** based on the **ABC pathway would be beneficial.**

(Hindricks G, et al. Eur Heart J. 2021)

Tsadok MA, et al. Circulation. 2012

Hindricks G, et al. Eur Heart J. 2021

Study Limitations

- Observational study.
- No information on glycemic control during follow-up period.
- Specific type of AF not identified.
- Restoration and maintenance of sinus rhythm after ERC unknown.

Conclusion

- Early rhythm control was associated with **lower risks of ischemic stroke, composite of macrovascular complications, composite of microvascular complications, and all-cause death** compared to usual care.

- **Early rhythm control within 1 year of AF diagnosis should be considered** to prevent adverse outcomes in patients with diabetes and new-onset AF.

Thank you for your attention
