Declaration of Interests

- Guideline membership/reviewing: ESC Guidelines on Atrial Fibrillation 2010 and Focused Update 2012, 2020; ESC Guidelines on Heart Failure, 2012; American College of Chest Physicians Antithrombotic Therapy Guidelines for Atrial Fibrillation, 2012; NICE Guidelines on Atrial Fibrillation, 2006 and 2014; NICE Quality Standards on Atrial Fibrillation 2015; ESC Cardio-oncology Task Force, 2015; ESC Working Group on Thrombosis position documents (2011-). Chairman, Scientific Documents Committee, European Heart Rhythm Association (EHRA). Chairman, 2018 CHEST guidelines from American College of Chest Physicians. Writing Group, 2021 Asia Pacific Heart Rhythm Society Guidelines on Stroke Prevention.
- Steering Committees/trials: Includes steering committees for various Phase II and III studies, Health Economics & Outcomes Research, etc. Investigator in various clinical trials in cardiovascular disease, including those on antithrombotic therapies in atrial fibrillation, acute coronary syndrome, lipids, etc.
- Editorial Roles: Editor-in-Chief (clinical), Thrombosis & Haemostasis; Associate Editor, Europace; Guest Editor, Circulation, American Heart Journal.
- Consultant/Advisor/Speaker:
 - Consultant and Speaker for BMS/Pfizer, Boehringer Ingelheim and Daiichi-Sankyo. No direct personal fees.

Stroke risk factors in patients with Atrial Fibrillation

Hindricks et al *Eur Heart J* 2020 doi:10.1093/eurheartj/ehaa612

Most commonly studied clinical risk factors (a systematic review) ³²⁴	Positive studies/All studies	Other clinical risk factors ³²⁵	Imaging biomarkers ^{291,326–328}	Blood/urine biomarkers ^{329–332}
Stroke/TIA/systemic embolism	15/16	Impaired renal function/ CKD	<i>Echocardiography</i>	Cardiac troponin T and I Natriuretic peptides
Hypertension	11/20	OSA	LA dilatation	Cystatin C
Ageing (per decade)	9/13	HCM	Spontaneous contrast or thrombus in LA	Proteinuria
Structural heart disease	9/13	Amyloidosis in degenerative cerebral and heart diseases	Low LAA velocities	CrCl/eGFR
Diabetes mellitus	9/14	Hyperlipidaemia	Complex aortic plaque	CRP
Vascular disease	6/17	Smoking	<i>Cerebral imaging</i>	IL-6
CHF/LV dysfunction	7/18	Metabolic syndrome ³³³	Small-vessel disease	GDF-15
Sex category (female)	8/22	Malignancy		von Willebrand factor D-dimer

CHF = congestive heart failure; CKD = chronic kidney disease; CrCl = creatinine clearance; CRP = C-reactive protein; eGFR = estimated glomerular filtration rate; GDF-15 = growth differentiation factor-15; IL-6 = interleukin 6; LA = left atrium; LAA = left atrial appendage; LV = left ventricular; OSA = obstructive sleep apnoea; TIA = transient ischaemic attack.

The CHA₂DS₂-VASc score

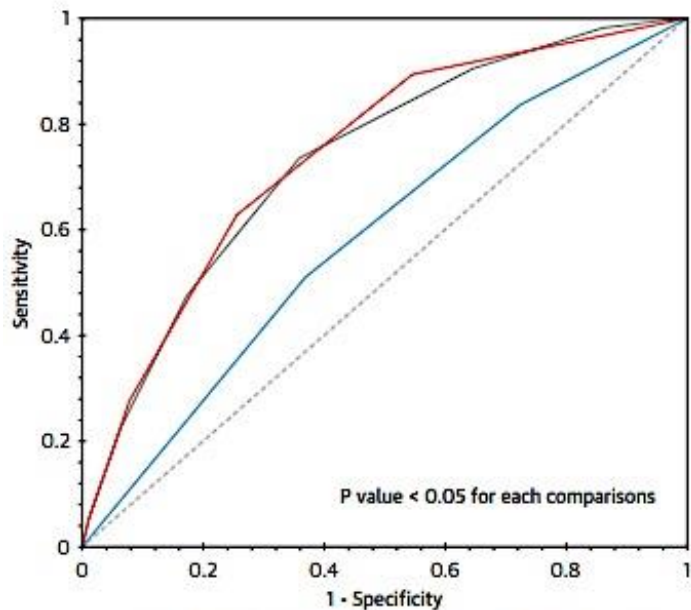

a) Risk factors for stroke and thromboembolism in non-valvular AF	
'Major' risk factors	'Clinically relevant non-major' risk factors
Previous stroke, TIA or systemic embolism Age \geq 75 years	Heart failure or moderate to severe LV systolic dysfunction [e.g. LV EF \leq 40%] Hypertension - Diabetes mellitus Female sex - Age 65-74 years Vascular disease*

Stroke risk factors	Score
<u>C</u> ongestive heart failure/LV dysfunction	1
<u>H</u> ypertension	1
<u>A</u> ged \geq 75 years	2
<u>D</u> iabetes mellitus	1
<u>S</u> troke/TIA/TE	2
<u>V</u> ascular disease [prior MI, PAD, or aortic plaque]	1
<u>A</u> ged 65–74 years	1
<u>S</u> ex category [i.e. female gender]	1

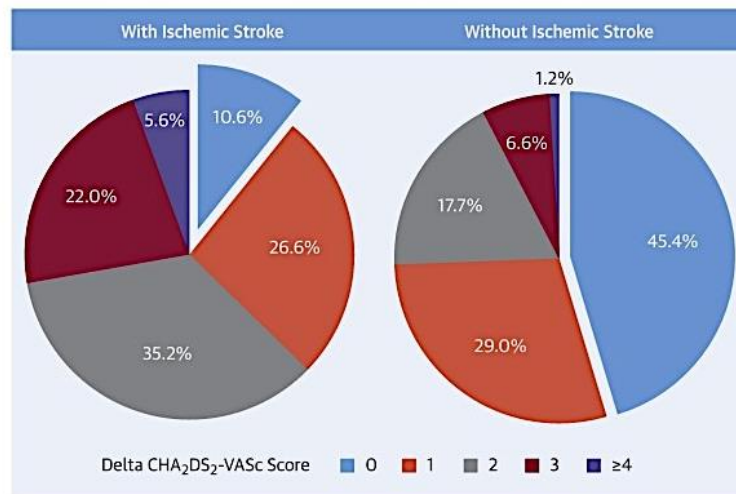

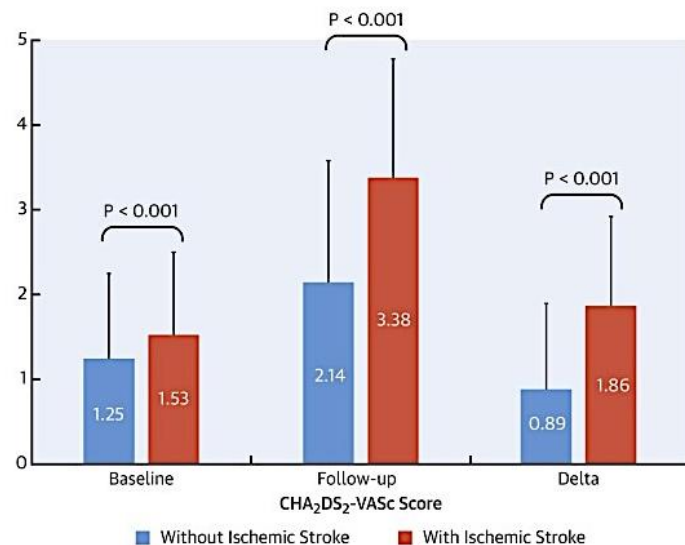

Lip et al. Chest. 2010;137:263-72.

CHA₂DS₂-VASc Scores of Patients With AF ± Ischemic Stroke: Baseline, Follow-Up, Delta

Chao, Lip et al J Am Coll Cardiol. 2018;71(2):122–32.

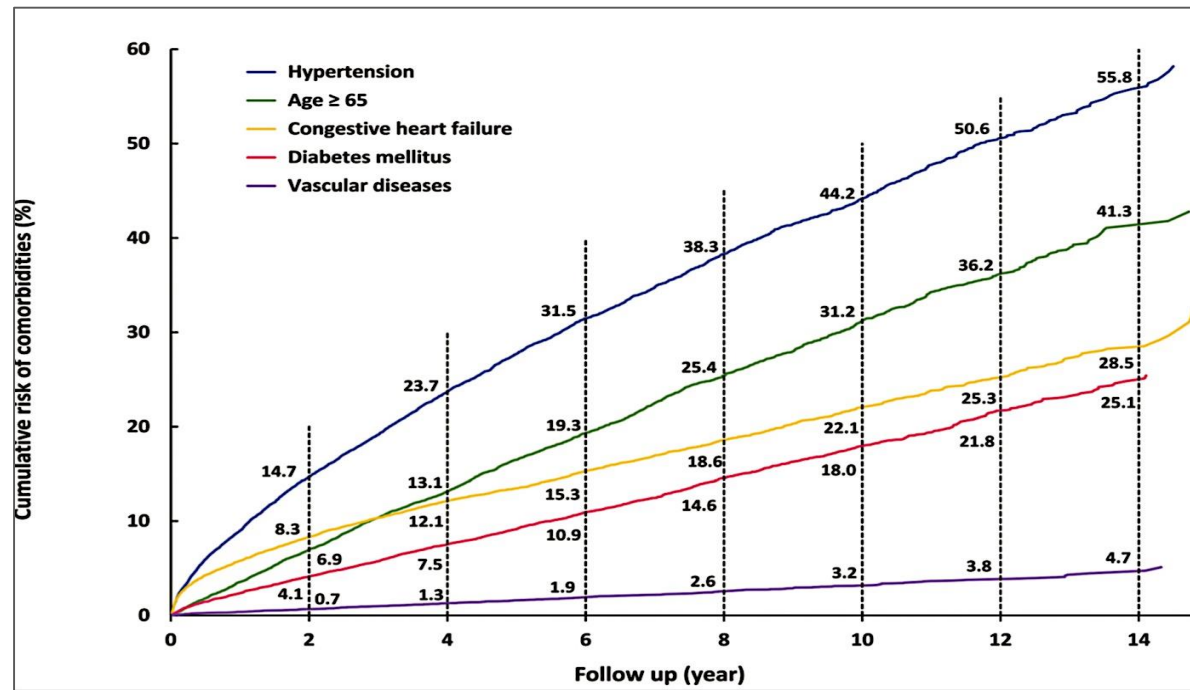

— Baseline CHA ₂ DS ₂ -VASc Score	AUC = 0.578 (0.569–0.587)
— Follow-Up CHA ₂ DS ₂ -VASc Score	AUC = 0.729 (0.721–0.737)
— Delta CHA ₂ DS ₂ -VASc Score	AUC = 0.742 (0.732–0.750)

Incident Co-Morbidities in AF Patients Initially with a CHA₂DS₂-VASc Score of 0 (Males) or 1 (Females): Implications for Reassessment of Stroke Risk in Initially 'Low-Risk' Patients

Chao .. Lip et al
Thromb Haemost. 2019
Jul;119(7):1162-1170. .

- In 80% of patients who acquired a comorbidity (HF, hypertension, diabetes or vascular disease), the new condition occurred after 4.2 months of AF diagnosis.
- Time from incident comorbidity to ischaemic stroke was >4.4 months for 90% of patients suffering stroke.

3-4 months may be a reasonable time interval at which stroke risk should be re-assessed, so that OACs could be prescribed timely.

Stroke risk factors in patients with Atrial Fibrillation

Hindricks et al *Eur Heart J* 2020 doi:10.1093/eurheartj/ehaa612

Most commonly studied clinical risk factors (a systematic review) ³²⁴	Positive studies/All studies	Other clinical risk factors ³²⁵	Imaging biomarkers ^{291,326–328}	Blood/urine biomarkers ^{329–332}
Stroke/TIA/systemic embolism	15/16	Impaired renal function/ CKD	<i>Echocardiography</i>	Cardiac troponin T and I Natriuretic peptides
Hypertension	11/20	OSA	LA dilatation	Cystatin C
Ageing (per decade)	9/13	HCM	Spontaneous contrast or thrombus in LA	Proteinuria
Structural heart disease	9/13	Amyloidosis in degenerative cerebral and heart diseases	Low LAA velocities	CrCl/eGFR
Diabetes mellitus	9/14	Hyperlipidaemia	Complex aortic plaque	CRP
Vascular disease	6/17	Smoking	<i>Cerebral imaging</i>	IL-6
CHF/LV dysfunction	7/18	Metabolic syndrome ³³³	Small-vessel disease	GDF-15
Sex category (female)	8/22	Malignancy		von Willebrand factor D-dimer

CHF = congestive heart failure; CKD = chronic kidney disease; CrCl = creatinine clearance; CRP = C-reactive protein; eGFR = estimated glomerular filtration rate; GDF-15 = growth differentiation factor-15; IL-6 = interleukin 6; LA = left atrium; LAA = left atrial appendage; LV = left ventricular; OSA = obstructive sleep apnoea; TIA = transient ischaemic attack.

Does chronic kidney disease improve predictive value of the CHADS₂ and CHA₂DS₂-VASc stroke stratification risk scores for AF?

*Roldan ... Lip
Thromb Haemostat 2013
May 2;109(5):956-60.*

Evaluating renal function in AF patients is important as CKD would confer a poor overall prognosis

Adding CKD to the CHADS₂ and CHA₂DS₂-VASc stroke risk scores did not independently add predictive information.

Stroke/systemic embolism	C-statistic (95% CI)	P	Relative IDI	P
CHADS ₂	0.650 (0.619–0.680)			
CHADS ₂ +CKD	0.636 (0.605–0.666)	0.442	0.7%	0.260
CHA ₂ DS ₂ -VASc	0.623 (0.592–0.654)			
CHA ₂ DS ₂ -VASc+CKD	0.612 (0.580–0.642)	0.451	0.3%	0.122
Thrombotic events	C-statistic (95% CI)	P	Relative IDI	P
CHADS ₂	0.628 (0.597–0.658)			
CHADS ₂ +CKD	0.629 (0.598–0.660)	0.917	0.3%	0.552
CHA ₂ DS ₂ -VASc	0.634 (0.603–0.664)			
CHA ₂ DS ₂ -VASc+CKD	0.636 (0.605–0.666)	0.908	0.7%	0.502
All cause death	C-statistic (95% CI)	P	Relative IDI	P
CHADS ₂	0.668 (0.638–0.698)			
CHADS ₂ +CKD	0.685 (0.655–0.714)	0.244	-2.5%	0.236
CHA ₂ DS ₂ -VASc	0.657 (0.627–0.687)			
CHA ₂ DS ₂ -VASc+CKD	0.672 (0.642–0.702)	0.224	-1.8%	0.290

CHADS₂: congestive heart failure, hypertension, age ≥75, diabetes mellitus, and prior stroke or transient ischaemic attack; CHA₂DS₂-VASc: congestive heart failure, hypertension, age ≥75, diabetes mellitus, prior stroke or transient ischaemic attack, vascular disease, age 65–74, female; CKD: chronic kidney disease; eGFR: estimated glomerular filtration rate; CKD: we add 1 point for eGFR 30–60 and 2 points for eGFR<30.

Evaluating increased predictive ability of Chronic Kidney Disease (CKD) adding to clinical risk scores (CHADS₂ and CHA₂DS₂-VASc) using C-statistics and and IDI indexes.

AF, atrial fibrillation; CRP, C-reactive protein; GDF-15, growth differentiation factor-15; IL-6, interleukin-6; LA, left atrium; LAA, left atrial appendage; MRI-LGE, magnetic resonance imaging-late enhanced gadolinium; NT-proBNP, N-terminal-pro B-type natriuretic peptide; sST2, soluble suppression of tumorigenicity 2; TGF-β1, transforming- growth factor-β1; vWF, von Willebrand factor.

Additive Role of Plasma vWf Levels to Clinical Factors for Risk Stratification in AF

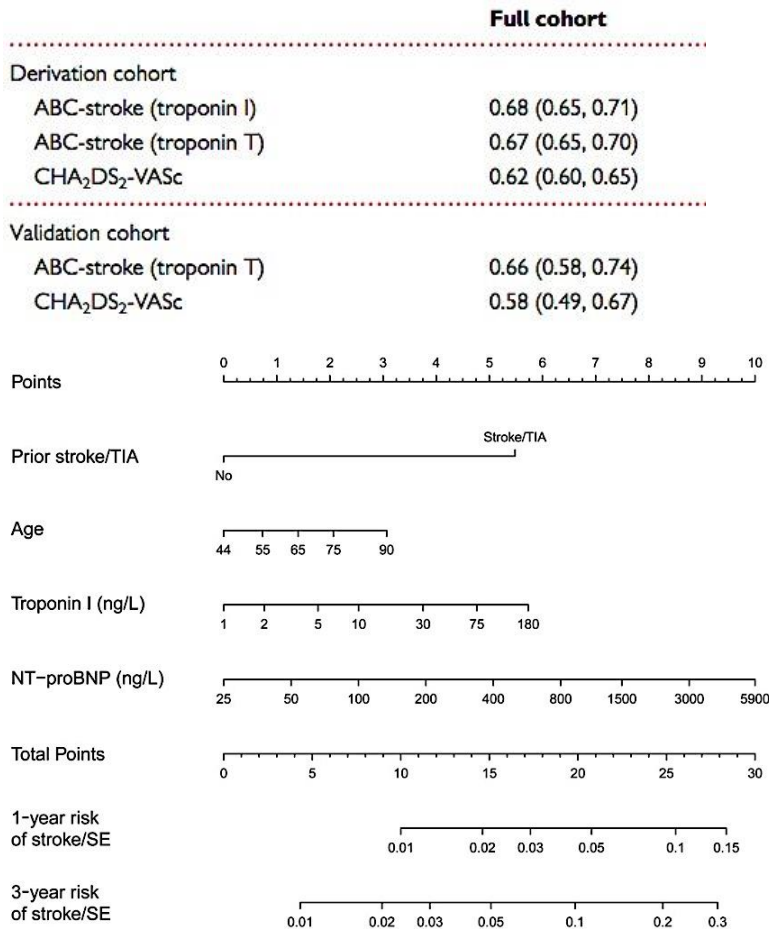

Lip et al Stroke 2006;37:2294-2300

Risk score level	Annualized Rate (95% CI)	vWf Level	Annualized Rate (95% CI)
Ischemic stroke			
Birm, low	0 (0–0)	Low	0
		High	0
Birm, moderate	1.95 (1.17–2.92)	Low	1.44 (0.69–2.48)
		High	3.18 (1.44–5.59)
Birm, high	5.75 (3.68–8.28)	Low	4.88 (2.51–8.04)
		High	6.98 (3.59–11.5)
CHADS ₂ , low	0.65 (0.12–1.60)	Low	0.54 (0.05–1.56)
		High	1.09 (0.00–4.27)
CHADS ₂ , moderate	2.72 (1.76–3.89)	Low	2.24 (1.22–3.56)
		High	3.73 (1.85–6.26)
CHADS ₂ , high	7.03 (3.92–11.0)	Low	5.68 (2.04–11.1)
		High	8.37 (3.79–14.7)

Annualized Stroke Event Rates for Birmingham (Birm) and CHADS₂ Risk Scores by vWf level

...

high plasma vWf level was defined as the top tertile (>158 IU/dL) of vWf levels in the study cohort. Low plasma vWf levels were defined as <158 IU/dL

ABC (age, biomarkers, clinical history) stroke risk score: a biomarker-based risk score for predicting stroke in AF

Hijazi et al Eur Heart J

2016 doi:10.1093/eurheartj/ehw054

- ABC score derived from a cohort on anticoagulant treatment (ARISTOTLE trial) and validated in a mixed population cohort—some treated with anticoagulation and some not (49%).
- Laboratories and commercial assays have variance and differences in reproducibility or lower limits of detection.

Biomarkers (whether blood, urine, or imaging-based) will always improve on risk prediction scores based on clinical factors ... at least statistically [Note c-indexes all <0.70]

Long-Term Stroke Risk Prediction in Patients with AF: Comparison of ABC-Stroke & CHA₂DS₂-VASc Scores

Rivera-Caravaca ... Lip, Marin. *J Am Heart Assoc.* 2017;6:e006490. DOI: 10.1161/JAHA.117.006490

	C-Index	95% CI	P Value	z Statistic*	P Value*	IDI	P Value	NRI	P Value
At 3.5 y									
ABC-stroke score	0.663	0.634 to 0.690	<0.001	1.998	0.046	0.019	0.002	0.002	0.903
CHA ₂ DS ₂ -VASc score	0.600	0.567 to 0.625	<0.001						
At 6.5 years									
ABC-stroke score	0.662	0.633 to 0.690	<0.001	1.574	0.116	0.019	0.002	-0.053	<0.001
CHA ₂ DS ₂ -VASc score	0.620	0.590 to 0.648	<0.001						

ABC-stroke indicates age, biomarkers (N-terminal fragment B-type natriuretic peptide, high-sensitivity troponin), and clinical history (prior stroke/transient ischemic attack); CHA₂DS₂-VASc, cardiac failure or dysfunction, hypertension, age ≥ 75 (doubled), diabetes mellitus, stroke (doubled)—vascular disease, age 65 to 74 years and sex category (female); IDI, integrated discriminatory improvement; NRI, net reclassification index; ROC, receiver operating characteristic.

*For C-index comparison.

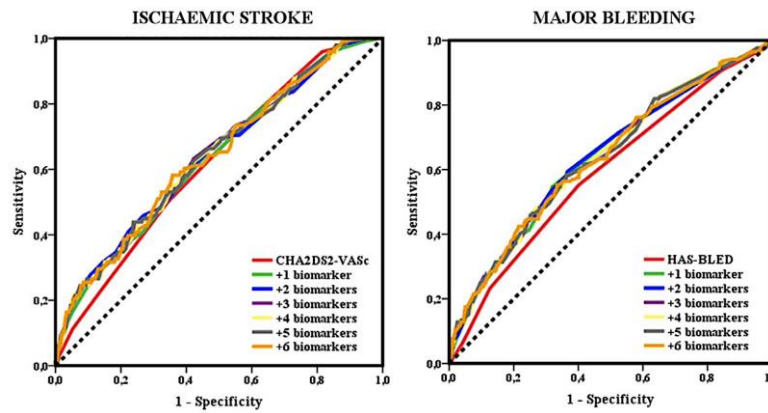

- At 6.5 years, 6.64% patients categorized as low-medium risk with ABC-stroke score experienced an ischemic stroke, vs 1.59% low-medium risk with CHA₂DS₂-VASc score.
- Patients at low-medium risk with ABC-stroke had a median CHA₂DS₂-VASc score of 3 (IQR 2–4) and a high risk of stroke per every CHA₂DS₂-VASc score point (hazard ratio, 1.3; 95% CI, 1.09-1.70, p=0.007)

ABC-stroke score did not provide better long term predictive accuracy for stroke in ‘real world’ AF patients. CHA₂DS₂-VASc score performed well in identifying patients at “low risk,” better than ABC-stroke

Refining Stroke and Bleeding Prediction in Atrial Fibrillation by Adding Consecutive Biomarkers to Clinical Risk Scores

Rivera-Caravaca .. Lip, Roldan. Stroke 2019;50(6):1372-1379.

Adding consecutive biomarkers, the predictive ability of CHA₂DS₂-VASc for ischemic stroke was not increased, whereas the predictive ability of HAS-BLED for major bleeding was only slightly enhanced statistically.

The net benefit and clinical usefulness of the biomarker-based models were marginal in comparison to the original scores based on clinical risk factors.

	C Index	95% CI	Z Score*	P Value*	IDI, %	95% CI	P Value	NRI, %	95% CI	P Value

Predicting Adverse Events beyond Stroke and Bleeding with the ABC-Stroke and ABC-Bleeding Scores in Patients with AF: The Murcia AF Project

Camelo-Castillo .. Lip et al *Thromb Haemost* 2020;120(8):1200-1207.

	ABC-stroke	ABC-bleeding	p-Value ^a
	c-index (95% CI)	c-index (95% CI)	
Myocardial infarction	0.535 (0.504–0.566)	0.542 (0.511–0.572)	0.880
Acute heart failure	0.600 (0.564–0.624)	0.614 (0.584–0.644)	0.504
Composite cardiovascular events	0.644 (0.615–0.674)	0.644 (0.613–0.672)	0.946
All-cause mortality	0.704 (0.676–0.732)	0.726 (0.698–0.753)	0.187

^ap-Value for c-index comparison.

Decision curve analyses for the primary endpoints.

- The ABC-stroke and ABC-bleeding scores demonstrated similar predictive ability for outcomes beyond stroke and bleeding, including MI, acute HF, a composite of cardiovascular events, and all-cause deaths.
- Consistent with nonspecificity of biomarkers that predict “sick” patients or poor prognosis overall.**

Controversies in cardiovascular medicine

Stroke and bleeding risk assessment in atrial fibrillation: when, how, and why?

Gregory Y.H. Lip*

University of Birmingham Centre for Cardiovascular Sciences, City Hospital, Birmingham B18 7QH, UK

Received 2 October 2012; revised 3 November 2012; accepted 25 November 2012

‘..... the value of clinical risk scores would be enhanced by biomarkers that can include blood markers (e.g. vWf), urine (for example, proteinuria, eGFR or creatinine clearance), cardiac imaging (echocardiography, whether transthoracic or transoesophageal) and/or cerebral imaging (e.g. CT or MRI imaging) which can offer incremental predictive value for the identification of ‘high risk’ subjects.

..... this would be at the cost of reduced simplicity and practicality, limiting its (immediate) ‘quick’ use in everyday clinical practice’

Beyond CHA₂DS₂VASc there remains a high residual risk

Cause of Death and Predictors of All-Cause Mortality in Anticoagulated Patients With Nonvalvular AF: Data From ROCKET AF

Pokorney et al J Am Heart Assoc. 2016;5: e002197 doi: 10.1161/JAHA.115.002197

	Rivaroxaban (n=582)	Warfarin (n=632)	HR (95% CI)	P Value
All-cause mortality	582 (4.5)	632 (4.9)	0.92 (0.82–1.03)	0.15
Vascular death	375 (2.9)	401 (3.1)	0.94 (0.81–1.08)	0.35
Nonvascular death	148 (1.2)	157 (1.2)	0.94 (0.75–1.18)	0.61
Death unknown cause	59 (0.5)	74 (0.6)	0.80 (0.57–1.12)	0.20
Sudden/unwitnessed death	169 (1.3)	174 (1.4)	0.97 (0.79–1.20)	0.79
CHF/shock cause of death	88 (0.7)	69 (0.5)	1.28 (0.93–1.75)	0.13
Malignancy cause of death	63 (0.5)	55 (0.4)	1.14 (0.80–1.64)	0.46
Intracranial hemorrhage death	27 (0.2)	43 (0.3)	0.63 (0.39–1.02)	0.06

Data are summarized as number of events (event rate per 100 patient-years of follow-up), unless otherwise indicated. CHF indicates congestive heart failure; HR, hazard ratio.

AF patients anticoagulated for nonvalvular atrial fibrillation, ~7 in 10 deaths were cardiovascular, whereas <1 in 10 deaths were caused by nonhemorrhagic stroke or systemic embolism.

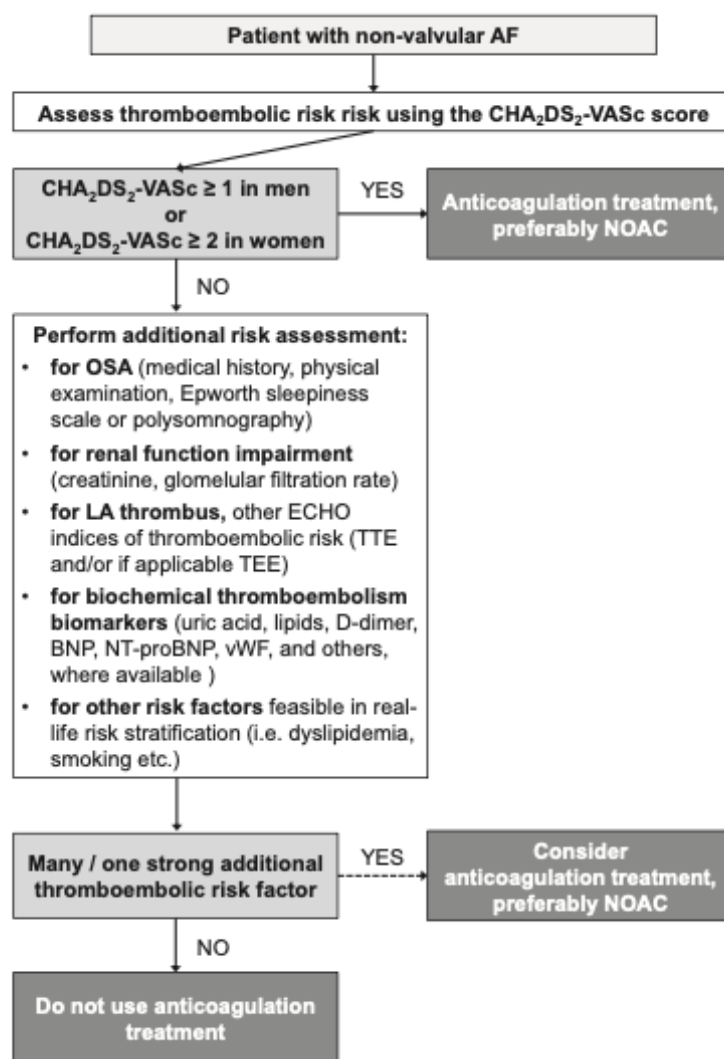

Optimal prevention and treatment of heart failure, renal impairment, chronic obstructive pulmonary disease, and diabetes may improve survival.

We make it complicated

Stroke Risk Factors Beyond the CHA₂DS₂-VASc Score: Can We Improve Our Identification of “High Stroke Risk” Patients With Atrial Fibrillation?

Legend: ^aadjusted for type of AF, EHRA score, use of OAC. HR hazard ratio. For other acronyms, please see previous tables' legends

Improving dynamic stroke risk prediction in non-anticoagulated patients with and without AF: comparing common clinical risk scores and ML algorithms

Lip et al *EHI-QCCO* 2021: doi:10.1093/ehjqcco/qcab037

The future?
Complicated ...

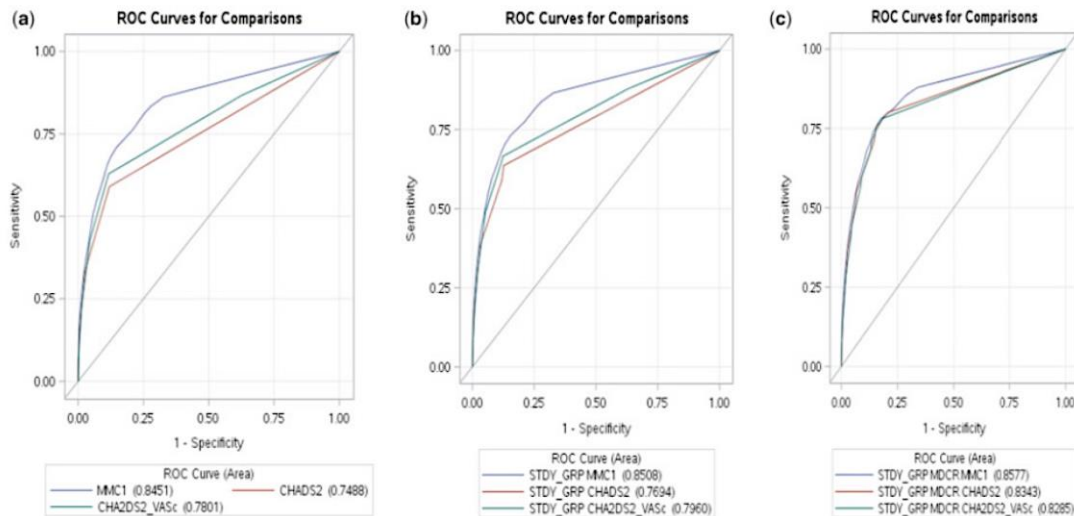

Figure 1 External validation for three sets of three clinical rule-based models: (A) Set 1: multi-morbid index 'MIMC1' (C index 0.8451, 95% CI 0.8427–0.8476), CHADS₂ (C index 0.7488, 95% CI 0.746–0.7516), CHA₂DS₂-VASc (C index 0.7801, 95% CI 0.7772–0.7831); (B) Set 2: multi-morbid index/AF status (C index 0.8508, 95% CI 0.8483–0.8532), CHADS₂/AF status (C index 0.7694, 95% CI 0.7667–0.7722), CHA₂DS₂-VASc/AF status (C index 0.796, 95% CI 0.7931–0.7989); (C) Set 3: multi-morbid index/AF status/Medicare status (C index 0.8577, 95% CI 0.8553–0.86), CHADS₂/AF status/Medicare status (C index 0.8343, 95% CI 0.8319–0.8368), CHA₂DS₂-VASc/AF status/Medicare status (C index 0.8285, 95% CI 0.8259–0.8312).

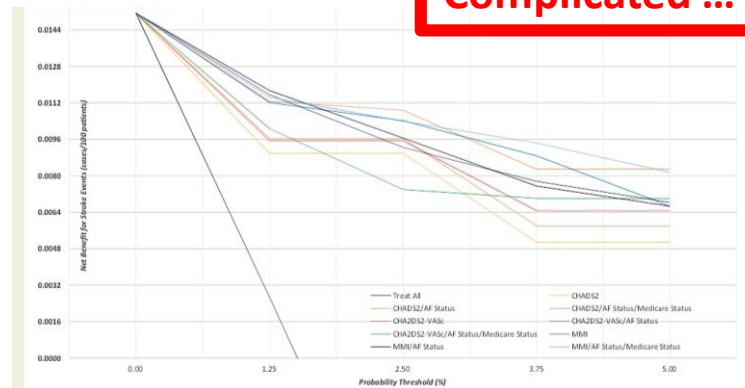

Figure 2 Clinical utility for stroke risk-based models using validation samples. AF, atrial fibrillation; MIM, multi-morbidity index.

The best prediction model was derived on the basis of non-linear formulations using ML criteria, with the highest c-index was obtained for logistic regression [0.892; 95% CI 0.886–0.898] with consistency on external validation (0.891; 95% CI 0.882–0.9).

These were significantly higher than those based on the conventional stroke risk scores (CHADS₂: 0.7488, 95% CI 0.746–0.7516; CHA₂DS₂-VASc: 0.7801, 95% CI 0.7772–0.7831) and multi-morbid index (0.8508, 95% CI 0.8483–0.8532).

Or we can keep it simple and practical

'A' Avoid stroke/anticoagulation

The default is stroke prevention* unless 'low risk'

...given the limitations of (all) risk scores

*Stroke prevention means oral anticoagulation, whether as well managed warfarin with good TTR (>70%) or (ideally) NOAC

Treat AF: The ABC pathway

1. Identify low-risk patients
CHA₂DS₂-VASc 0(m), 1(f)
2. Offer stroke prevention if
CHA₂DS₂-VASc ≥1 (m), 2(f)
Assess bleeding risk, address
modifiable bleeding risk factors
3. Choose OAC (NOAC or VKA
with well-managed TTR)

Assess symptoms,
QoL and patient's
preferences

Optimize rate
control

Consider a rhythm
control strategy
(CV, AADs, ablation)

Comorbidities and
cardiovascular risk
factors

Lifestyle changes
(obesity reduction,
regular exercise,
reduction of alcohol use,
etc.)

2020 ESC Guidelines for the diagnosis and management of atrial fibrillation developed in collaboration with the European Association of Cardio-Thoracic Surgery (EACTS)

Thinking outside the CHA₂DS₂VASc Box ...

Let me conclude with this:

Impact of adherence to the ABC pathway on clinical outcomes in patients with AF

*Romiti .. Lip, Proietti.
